WHO

SYSCOM: MARCOR
Sponsoring Program: Combat Support Equipment
Transition Target: Expeditionary Shelter Systems (ESS)
TPOC: sbir.admin@usmc.mil
Other transition opportunities: Expeditionary shelter systems for other DoD components, temporary shelters for disaster recovery

WHAT

Operational Need and Improvement: The US Marine Corps seeks to
1. Reduce the logistical footprint associated with expeditionary shelter systems
2. Improve softwall shelter insulation qualities
3. Reduce the energy required for maintaining internal temperatures

Specifications Required:
• Improved insulation capabilities of softwall shelter insulating barrier systems (R-value no less than 4 with an objective of 8).
• Decreased packed cube/size and weight by a minimum of 25% (thickness no more than 0.25 in with an objective of at least 0.125 in, when packed / weight no more than 12 ounces per square yard with an objective of 8 ounces per square yard).
• Man-portable by 2-4 personnel, durable, and capable of being deployed and stored for up to 15 years without degradation or damage.
• Materials meet the following standards: AATCC 30 Antifungal Activity, CPAI-84 Flame-Resistant Materials Used in Camping Tentage, ASTM D6413 Test Method for Flame Resistance of Textiles.
• Function in all climates and environments encountered by USMC forces (pass applicable tests outlined in MIL-STD 810F/G with no performance degradation in between 125° F and -40° F).

Technology Developed: ATA Engineering has developed a lightweight and compact insulating barrier for expeditionary shelters based on a tensioned cellular fabric design concept. Using entrapped air as the primary insulator, it incorporates low-emissivity coatings to maximize system R-value. The barrier replaces both the existing interior liner and radiant barrier used in the ESS/Medium, greatly reducing the logistical footprint while improving insulative performance.

Warfighter Value: Because the insulating barrier integrates with a widely fielded shelter system (ESS/Medium, HDT Base-X® 305) and is extensible to several other shelter models, it promises to provide immediate and realizable reduction in the HVAC requirement (and associated power, fuel, and packed physical space) associated with expeditionary missions.

WHEN

Contract Number: M67854-16-C-6505 Ending on: November 30, 2018

HOW

Projected Business Model: ATA is collaborating with HDT Global, manufacturer of the Base-X® family of expeditionary shelters, to bring the product to market. HDT will license the technologies embodied in the insulating barrier from ATA.

Company Objectives: To continue involvement in the engineering, analysis, and optimization of the insulating barrier design and development of derivative products for other shelter models and families.

Potential Commercial Applications: Camping tents, home insulation, temporary housing
