

Data from Difficult ENVIRONMENTS

Technology should provide people with accurate information to make the best decisions. We design, develop, and build products tailored to help our customers collect data from the most difficult environments, focusing on small unmanned vehicles and sensor systems. SeaLandAire delivers faster innovative solutions.

Be More Accurate.

Data from Difficult ENVIRONMENTS

We believe our niche is to provide rapid design, build and test cycles for complex systems with strong size, weight, and power limitations (SWaP) - at particularly competitive costs. This is especially valuable for risk mitigation early in projects, or in quick response to problems as they arise.

Case Study

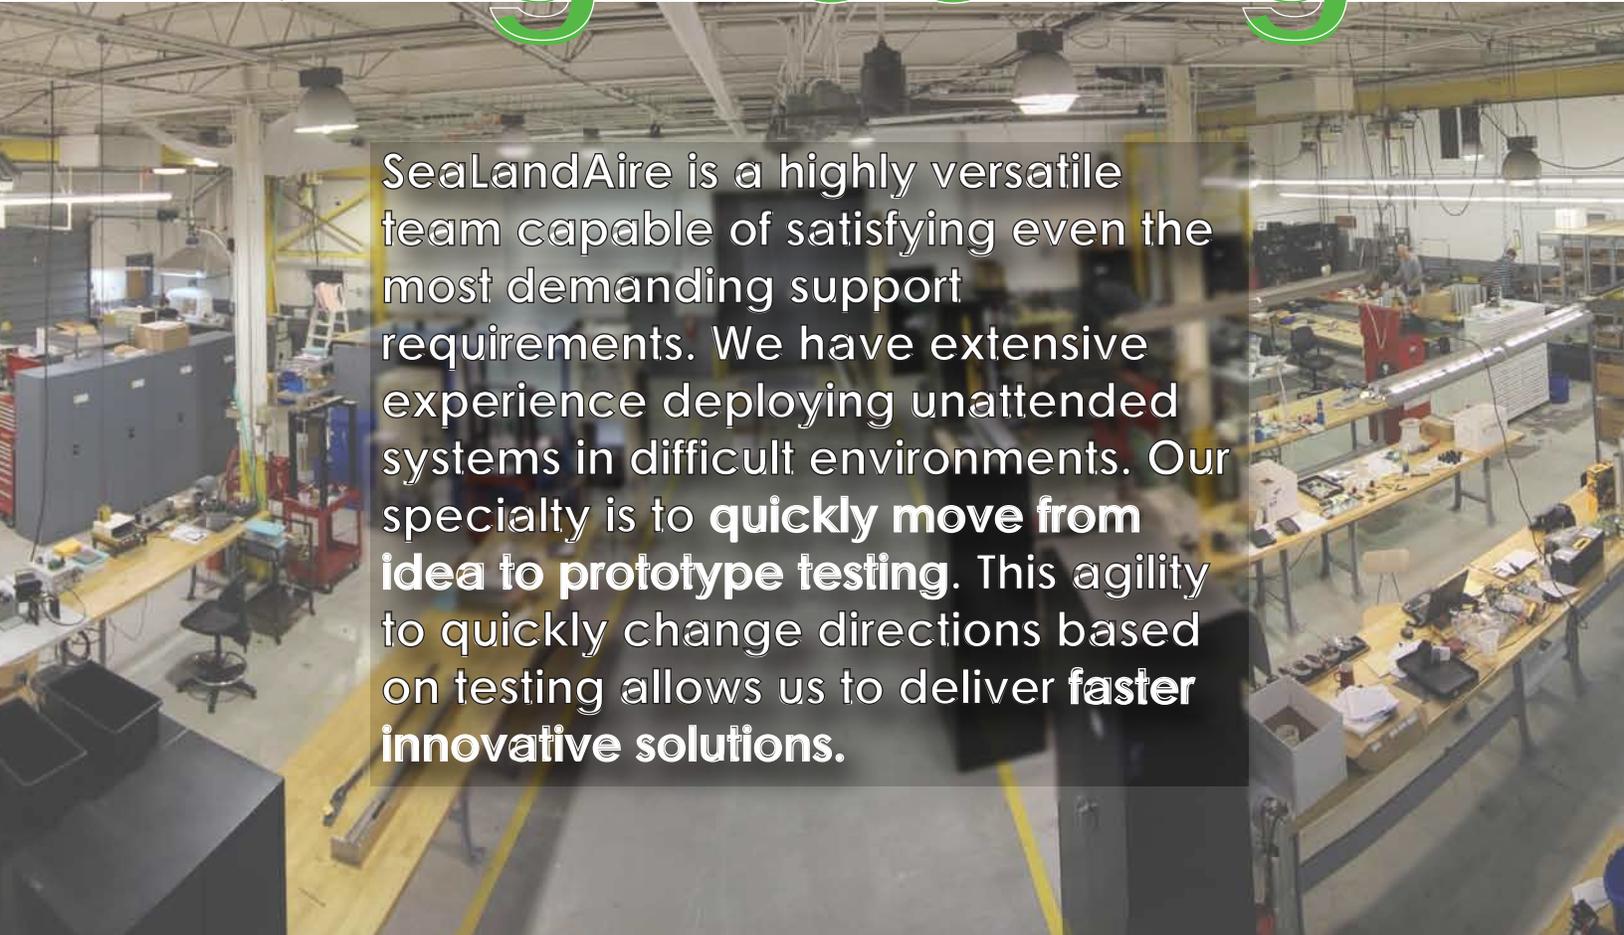

We were approached by another business in need of a propulsion and navigation system for small UUV. The timeline was tight, as they had spent several unsuccessful months in budget negotiations with a larger firm. SeaLandAire placed a competitive bid which was quickly accepted. Within 6 months, we built two hardware revisions, completed two full system tests, and delivered two units featuring a tuned propulsion system and a compass based dead reckoning navigation solution on time and in budget.

We don't over promise, **we deliver.**

Our engineering facility is equipped with a dedicated **battery development** center, **acoustics** lab with an **acoustic calibrator**, and a full **prototype fabrication** lab and testing facility.

Design, Test, & Fabrication

Integrated Engineering

SeaLandAire is a highly versatile team capable of satisfying even the most demanding support requirements. We have extensive experience deploying unattended systems in difficult environments. Our specialty is to **quickly move from idea to prototype testing**. This agility to quickly change directions based on testing allows us to deliver **faster innovative solutions**.
