Taylor & Lego Holdings, LLC (TLH) / Rapid Composites

Affordable Reinforced Polymer Composite Structures with Embedded Electrical Interfaces

Taylor & Lego Holdings (TLH), dba/Rapid Composites, a 20-year provider of engineering and manufacturing services has developed alternative composite construction methods that improve cycle-times and dimensional tolerances; reducing costs and enabling very repeatable mid-to-high-volume production. Initially targeting Coyote UAS components, TLH has produced over 60 rugged handheld devices, transit cases, drones, control surfaces, complex fuselage assemblies, and the FLIR MLR Aka/Recon 5 (passed government testing) with greater repeatability and substantially better cycle times. Additionally, TLH demonstrated the ability to produce tubular fuselage components for MDA with embedded electrical interfaces in minutes instead of days. TLH seeks partners/investors that'd benefit mission critical and harsh environment products, which typically are companies looking to produce >5 parts/annum that require more accuracy than low pressure processes are capable of.

Affordable Reinforced Polymer Composite Structures with Embedded Electrical Interfaces
Taylor & Lego Holdings, LLC (TLH) / Rapid Composites

Operational Need and Improvement: Existing unmanned air and sea based vehicle fuselages, control surfaces, lift surfaces, chasises, bulkheads, and other internal structures can in most instances, be easily transitioned to and used with composites. The materials and processes employed by TLH have demonstrated better consistency/repeatability, reduced component weight, improved the EMI/RFI and/or thermal properties, and reduced the cycle times across the entire Coyote assembly.

Specifications Required: SWAP-C improvements to the platform are a direct benefit from the extremely fast-processing speeds and unique ability to offer in many instances more sophisticated, tailored structural, lightweight materials than more conventional technologies. There are many instances where heavier aluminum structures were transitioned into 3-D oriented, discontinuous carbon materials. Even bulkheads with complex geometry (with ribs, gussets, etc.), is capable of being molded in five minutes or less, eliminating laborious machining processes and hours of work, substantially improving the cost, weight and functionality.

Technology Developed: There are both pre-existing and newly envisioned construction methodologies that have been utilized for the Coyote 3B program. These include materials science applications (existing and post technologies), construction methodologies (existing and post technologies), fabrication techniques (existing and post technologies), unique tooling approaches and technologies (existing and post technologies), robotic composite molding work-cells (exclusively owned by TLH). These technologies can be applied to a wide array of military and commercial products that can benefit from better consistencies, reduced part counts, lighter materials, and faster cycle times.

Warfighter Value: Lighter parts for a drone can improve flight times and increase payload capacity. Better material selection and processing techniques improve production consistency. There is a more linear/iterative approach to the structural design process, making fine-tuning structural enhancements more predictable. Better manufacturing methods make the products more reliable and the mid to high volume process ensures that the supply can meet demand expectations.
